`AUC_Spline_matrix_B` *Spline Interpolation Method - Matrix of the zero order derivative coefficients*

Description

In the area under the curve calculation using the spline interpolation method, the vector of the second derivative of the outcome of interest Y is expressed as $AY^{''} = BY + F$. This function calculate calculate the matrix B.

Usage

```
AUC_Spline_matrix_B(time)
```

Arguments

`time`	a numerical vector of time points of length m (x-axis coordinates).

Details

The tridiagonal matrix B is defined as (for the "not-a-knot boundary conditions): The jth line of the matrix, $B_{[j,\ :]}$ is given by

$$B_{[j,\ :]} = (0, \cdots, 0)\ if\ j = 1$$

$$B_{[j,\ :]} = (0, \cdots, 0)\ if\ j = m$$

$$B_{[j,\ :]} = \left(0_1, \cdots, 0_{j-2}, \frac{1}{h_j}, -\left[\frac{1}{h_j} + \frac{1}{h_{j+1}}\right], \frac{1}{h_{j+1}}, 0_{j+2}, \cdots, 0_m\right)\ otherwise$$

Value

a tridiagonal matrix corresponding to the weights of the variable of interest in the spline interpolation method. In this version, the matrix is build considering the "not-a-knot" spline boundary conditions.
